Hello!

To familiarize yourself with the procedures, please read the procedures section of the undergraduate thesis linked below.

https://stars.library.ucf.edu/hut2024/661/

An important distinction is that from the thesis procedures, task two is task three (superthreshold stim) and task three is task four (two alternative forced choice) for the labeling of the data (i.e code references, xdf file labeling, etc). This is because the second task was not described in the thesis.

The files within the attached folders contain basic preprocessing steps to obtain the source localization and general epochs from the raw data. The raw data files can be found in the one drive for the project in the deidentified data folder.

Each step of preprocessing has an attached readme file that should guide you through the process. If you have any questions, please reach out!
